

The Most Secure Encryption System Ever Created

7Tunnels Silencer™

Linked, Quantum-Proof Communications For the Boardroom or the Battlefield

Mobility Shouldn't Compromise Your Data Security

When you're out of the office, the communications you send can be easily intercepted by cybercriminals, giving them powerful leverage against you, your company and your shareholders. Hostile nations and bad actors are harvesting emails, texts, VOIP calls and file transfers knowing that emerging quantum computers will soon allow them to expose the secrets encrypted within your sensitive communications.

Total Future Secure Protection

The Silencer builds upon 7Tunnels PG7 technology to create the most secure possible connection between multiple users. Using proprietary software, PG7 Silencers are linked to create a web of dedicated quantum-proof encryption tunnels. Whether linking two or 20 Silencers, every user can communicate securely with any other user in the web, without fear that the encryption protecting those messages will ever be exposed by quantum computers.

Connect as many Silencers as you need, then communicate via phone, tablet or laptop with perfect security.

When You Need Absolute Security Between Team Members... Across the Room or Across the World.

Perfect Secrecy

Just like the PG7, the Silencer is a lightweight, portable electronic device (PED) that can be easily carried in your briefcase, bag or pocket. It's simple to use and turns any Wi-Fi system – from coffee shops and hotel rooms to conference centers and competitors' offices – into a secure, trustworthy network. And because Silencers are linked, the information sent and received when they're in use is 100% protected with quantum-proof encryption.

Trusted by Fortune 500 Companies

7Tunnels encryption has been vetted and tested in real-world applications. After 12 months of proof-of-concept testing, both DuPont and its spin-off, Corteva, now use 7Tunnels products to protect the communications of their traveling executives.

Confirmed by Respected Computer Scientists and Engineers

7Tunnels quantum-proof encryption technology has been reviewed and analyzed by experts in cyber and computer science, including two Georgia Tech professors, whose in-depth analysis of 7Tunnels technology confirmed its performance and effectiveness.

The Batphone only exists in comics. The White House "red phone" is a Hollywood invention. But the Silencer is real. So now you need to decide: who should be part of your 7Tunnels Silencer network?
